A BUFFER COMPOSITION AND METHOD FOR HYBRIDIZATION OF MICROARRAYS ON ADSORBED POLYMER SILICEOUS SURFACES

ABSTRACT OF THE INVENTION

A buffer composition, method and kit for hybridizing microarrays of nucleic acids bound to an adsorbed polymer surface of a siliceous substrate provide an envelope of conditions to hybridize nucleic acid targets, while preserving the intactness of the adsorbed polymer surface of the array. The buffer composition comprises a non-chelating buffering agent, a pH within a range of pH 6.4 and 7.5, a monovalent cation having a monovalent cation concentration that ranges from about 0.01 M to about 2.0 M, and optionally relatively lower concentrations of a chelating agent and an ionic surfactant. The total cation concentration of the buffer composition ranges from about 0.02 M to about 2.0 M. The method comprises incubating the targets with the microarray in the buffer composition at a temperature between about 55°C and 70°C.
